

Events (WeLive)

The purpose of this feature was to build a stronger community within WeLive buildings through physical gatherings.

Role - Lead Designer / Platform - iOS/android

WeLive Events

What are events at WeLive?

The best team I've ever been a part of, hands-down, was the WeLive team. We were a nimble group of 5 Engineers, a Product Lead, and me acting as the Design Lead. For six months, we tackled difficult problems with how technology can be used within the living space to better the social, utility, and support experience of living.

One of these was adding events to the app. All events up to then were created by the Community Team who ran the buildings. Members discovered events through posters and tv screens within the space, or even word of mouth. It did the job for many of the official events in the space, but didn't help members who wanted to make their own. Often members would post on the building feed, minutes before their own gathering, that they were having a dinner party or organizing a group run. And because of that, attendance suffered. We thought this was a great opportunity not to only let members create and advertise their own events and gatherings, but allow other members to be proactive in seeing upcoming events that week.

Research and workshops

I wanted to first dissect the problem in as many ways I could. I set up interviews with 10 members, 5 at both locations, to get a better idea of what members thought about events currently. I also reached out to the Community Teams to get their take as well.

After picking out common themes and important points from the research, I formed insights and take-aways for our team to then discuss. Then, for our weekly 'Design Humpday' (Every Wednesday I organized a meeting to get devs/product/design in a room to do a design exercise), I wanted us to do a How Might We exercise on some of this information to see where we could take a potential events feature. This was great for a few reasons. It allowed everyone on the team to get say early on in the process. It also surfaced ideas that I may never have thought of.

Problem statement

Events are a hallmark of community in WeLive Spaces. However, a lack of event diversity in NYC, having too many sources for event information, hosting events in inadequate spaces, and absent cm participation has hurt the member satisfaction of events.

+ Crystal City members also valued events that involved CM participation, as they feel like the CM team helps to facilitate interactions.

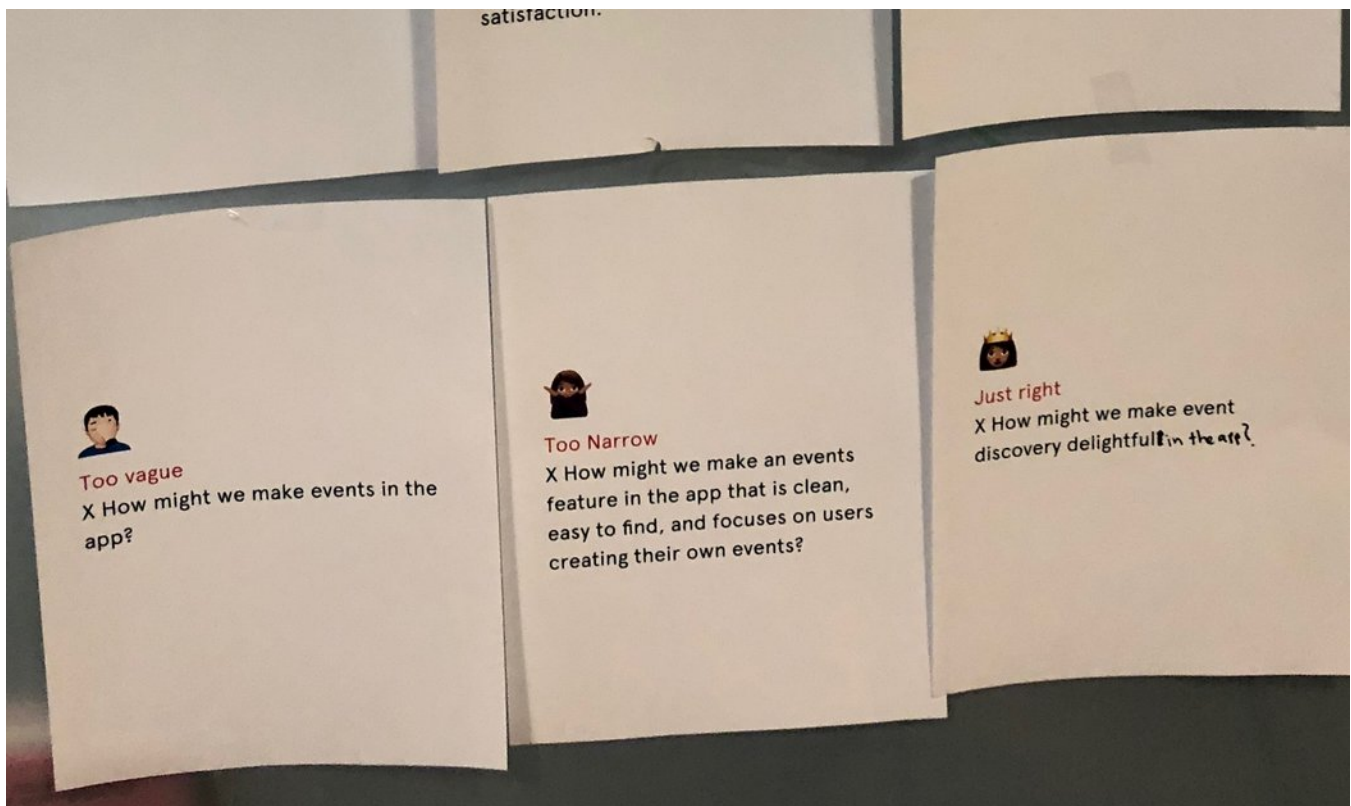

+ Both communities enjoy the weekly Sunday dinners.

Problem statement + insights

+ Events that utilized areas with enough seating were particularly favored by the Crystal City members, such as outdoor areas versus kitchens.

+ In Crystal City, members feel that they have too many channels for events and that conflicting information is shared. For them, they use an events email, posters, a Facebook Group, as well as the App. For Crystal City, one form of information about events could help to increase attendance and satisfaction.

+ Members are often aware of events, but they feel it's inconvenient to discover events when they want to.

The devs had never done a How Might We exercise before, so I tried to give them an idea of what the Goldilocks zone is for HMW statements.

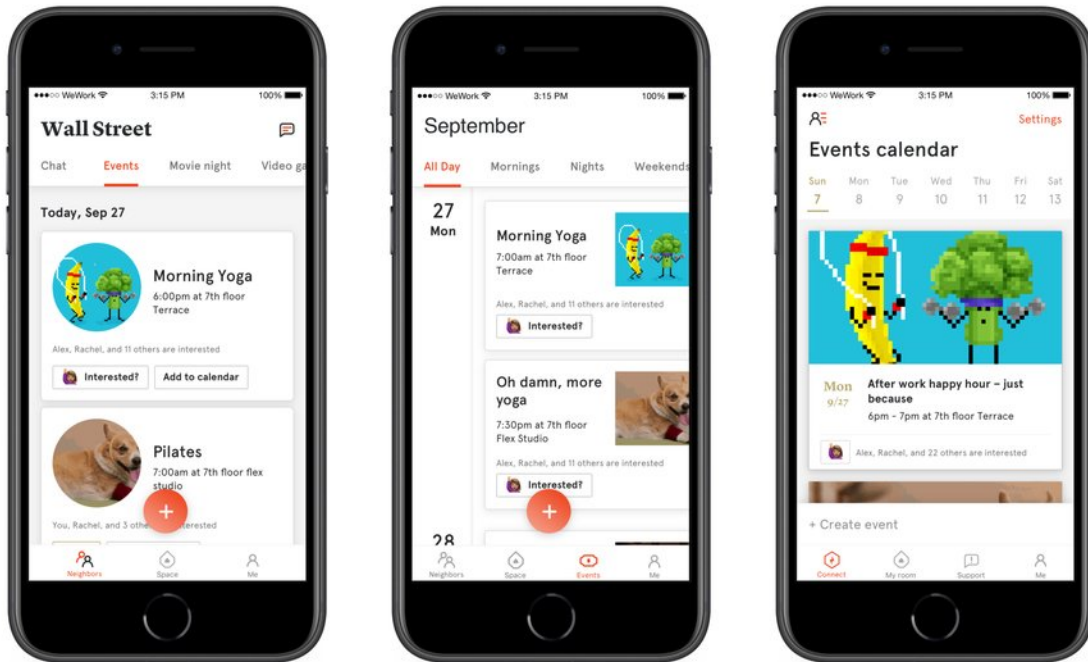

Exploration & Failed ideas

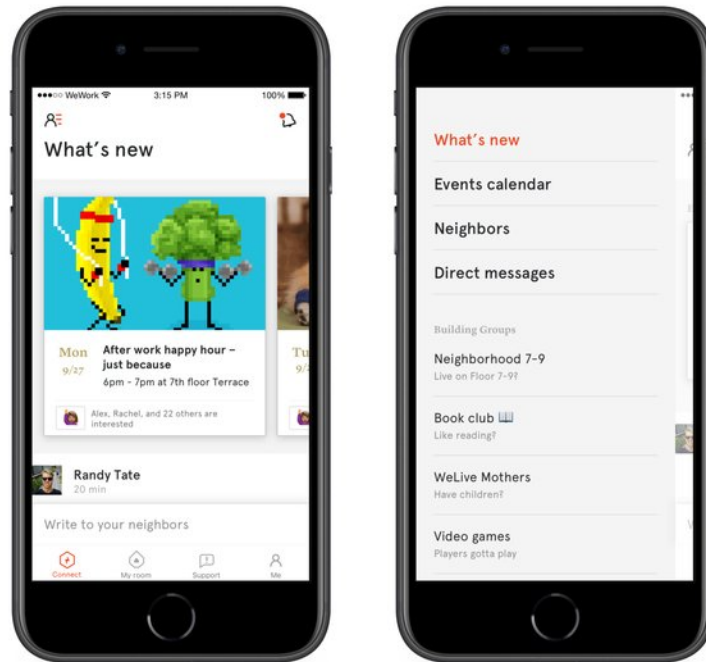

It was then time to do exploration. Luckily, by this point, I had worked on the WeLive app's information architecture so that I would know where events would sit in the world of WeLive. A few explorations and concepts were tested and either passed on by users in testing, or because it didn't solve a particular goal.

Mid-fidelity calendar concepts
(Failed-in-testing or rejected in critiques)

I tested a couple of 'calendar-like' interfaces with users. Out of the dozen or so wires, these tested the best. However, through critique from the team, we decided as a group to move away from a 'calendar-like' interface. 1 - because it felt odd to...

Mid-fidelity 'What's new' concept
(Failed-in-testing or rejected in critiques)

I experimented with the placement of events earlier to this process. One idea, that evolved into the final IA of the WeLive App, involved having an Events Calendar live in a menu while the 'What's new', where a user lands, feed events the user might...

Mid-fidelity concepts

(Ideas that came out of testing - event types and GIFs)

Two great ideas that came from testing were 'grouping' events and GIFs. Users overwhelmingly stated that they thought it would be great to filter events. For example, they may not be into yoga, but they do love food. So they would like a way to not ...

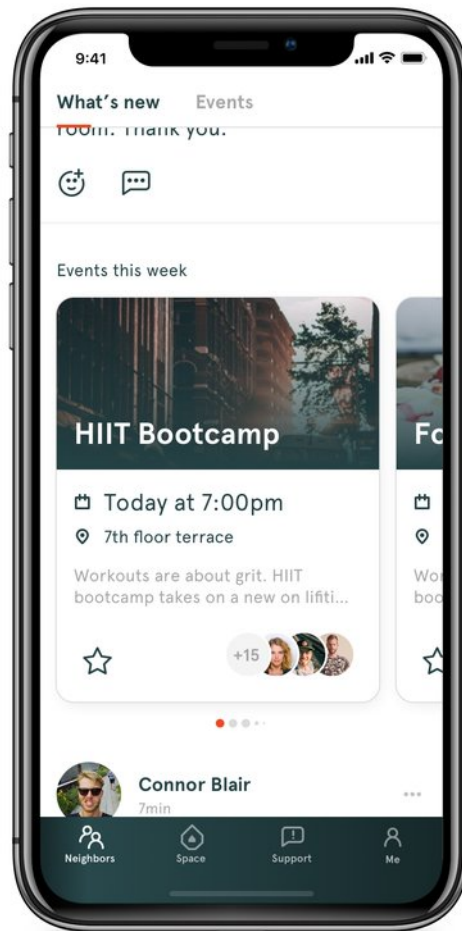

Final placement for events

With the IA locked in, Events seemed naturally to fit beside the building's feed. This tested well, and allowed us to not overcomplicate the product. We also looked into a way to show events this week on the 'What's new' tab as well.

Events - top right tab

Events - on What's new tab

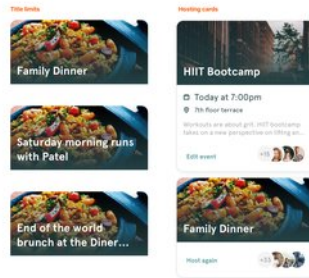

Events card

Piece by piece, I started working on the ui elements, cards, and basic patterns for the event's feature. This began with the card that will sit in the building feed and the events feed. How this ui element 'flexed' with data and screen sizes was important. What happens if there isn't a photo? How is time presented? Designing out those use cases made the developer's life easier.

Along with the card, I made an animation activate when a user taps the star. This adds delight and was something we planned on measuring to see if it increased event saves or not. You can view the animation [here](#).

Event card limitations and constraints

Default images

Notifications

Thinking beyond the ui is important as well. When do users get push notifications and when don't they? So mapping out those use cases mattered.

Event reminders

Event updates

WELIVE now
The host of Family Dinner has made updates to the event.

Event cancellations

WELIVE now
The host of Family Dinner has cancelled the event.

New event conversations

WELIVE now
Wendy posted to Family Dinner. Check out what they said.

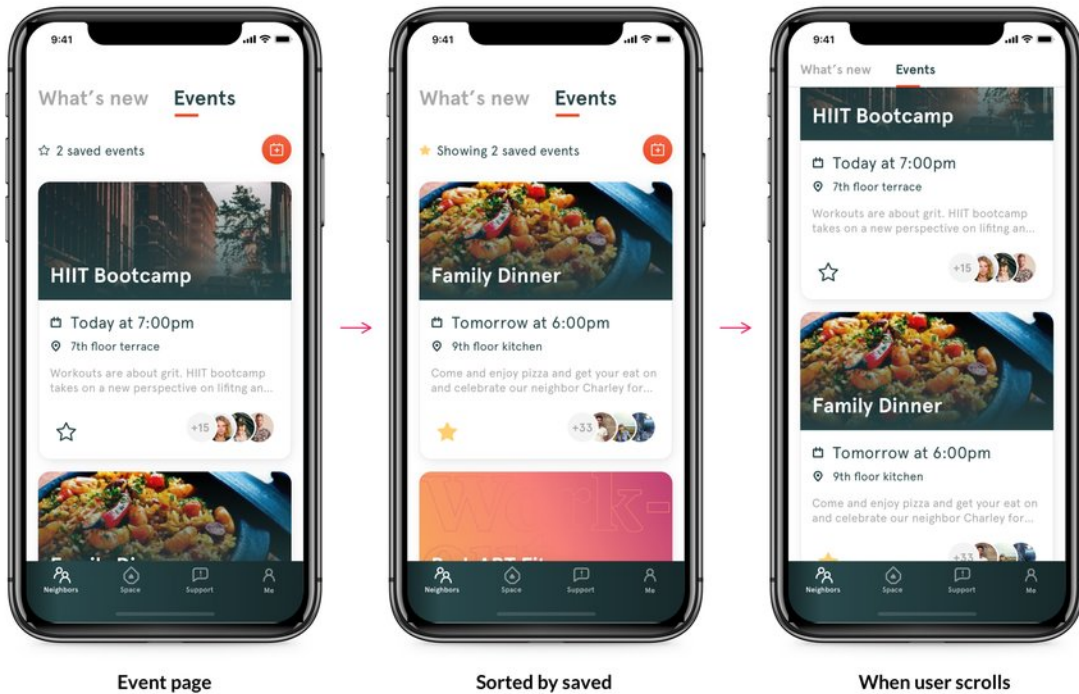

Event feedback

WELIVE now
Hey there, how was 'Cooking with Christian Cooper'? Send us your feedback!

Events final outcome

There is so much more to the events feature that I can dig into, but this page need to end at some point. So the following will showcase the events feed, the events view, and events creation. This was a feature that was designed for Android as well, with few differences between iOS and Android, but never ended up into code—due to our Android App falling behind our dev cycle.

Adding the ability to add photos (because hosts could have recurring events) seemed like a natural follow up to releasing this feature. Users were uploading pictures from events already on the building feed, and this would give users a place to coll...

Hosting an event

Hosting an event is best presented as a flow rather than a bunch of screenshots in phone frames. This is an asset uploaded to Zeplin for our devs to follow the flow accurately.
